FEB 25 2005

In the Specification:

On page 13 at line 17, please amend the specification as follows:

During a Full Synch replication, the ~~[[IHaveList]]~~IHaveList 94a may be sent to the member 40 from the controller 70. The member may then check its own content and reply with the ActionList 94b that requests the changes needed. The controller 70d may then respond with UpdateList 94c providing the information requested for that update. During an Automatic replication, the Replication Engine may send UpdateLists 94c to the target members informing them of changes as they occur on the controller 70. For example, The UpdateList 94c may be an XML blob that describes what the update is, what data is being updated, and the actual update - if desired. There may be an ACTION parameter (not shown) that describes how the updated item should be handled during automatic updates. For example, the parameter's value may be SET to update and/or change an existing item, DEL to delete an existing item, and/or ADD to create a new item.
